

1. 求幂级数 $\sum_{n=0}^{\infty} \frac{x^n}{n+1}$ 的和函数 $s(x)$.

1. 记 $s(x) = \sum_{n=0}^{\infty} \frac{x^n}{n+1}$ 收敛半径 $R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right| = 1$

由 $\frac{d}{dx}(xs) = \frac{d}{dx} \sum_{n=0}^{\infty} \frac{x^{n+1}}{n+1} = \sum_{n=0}^{\infty} x^n = \frac{1}{1-x} \quad (|x| < 1)$

因此 $xs = \int \frac{1}{1-x} dx = -\ln(1-x) + C$,

$s = -\frac{\ln(1-x)}{x} + \frac{C}{x}$

注意到当 $x \rightarrow 0$ 时 $s = 0$, 故 $C = 0$

$s = \frac{-\ln(1-x)}{x}, |x| < 1$

2. 求幂级数 $\sum_{n=0}^{\infty} \frac{x^{2n+1}}{n!}$ 的和函数, 并求数项级数 $\sum_{n=0}^{\infty} \frac{2n+1}{n!}$ 的和.

2. $R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right| = \infty$

故幂级数 $\sum_{n=0}^{\infty} \frac{x^{2n+1}}{n!}$ 的收敛区间为 $-\infty < x < +\infty$,

和函数 $s(x) = x \sum_{n=0}^{\infty} \frac{x^{2n}}{n!} = x e^{x^2}$

逐项求导得 $\sum_{n=0}^{\infty} \frac{2n+1}{n!} x^{2n} = (x e^{x^2})' = (1+2x^2)e^{x^2}$

令 $x=1$, $\sum_{n=0}^{\infty} \frac{2n+1}{n!} = 3e$.

3. 求级数 $\sum_{n=0}^{\infty} \frac{(-1)^n (n^2 - n + 1)}{2^n}$ 的和.

3. 设 $S(x) = \sum_{n=0}^{\infty} (n^2 - n + 1) x^n, [1]$

$$R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right| = \lim_{n \rightarrow \infty} \left| \frac{n^2 - n + 1}{(n+1)^2 - (n+1) + 1} \right| = 1$$

收敛域为 $(-1, 1)$

$$\sum_{n=0}^{\infty} n^2 x^n = x \sum_{n=0}^{\infty} (n x^n)' = x \left[x \sum_{n=0}^{\infty} (x^n)' \right]' = x \left[x \left(\frac{1}{1-x} \right)' \right]'$$

$$= \frac{x(x+1)}{(1-x)^3}$$

$$\sum_{n=0}^{\infty} n x^n = x \sum_{n=0}^{\infty} (x^n)' = x \left(\sum_{n=0}^{\infty} x^n \right)' = \frac{x}{(1-x)^2},$$

$$\sum_{n=0}^{\infty} x^n = \frac{1}{1-x}$$

$$\text{故 } S(x) = \sum_{n=0}^{\infty} n^2 x^n - \sum_{n=0}^{\infty} n x^n + \sum_{n=0}^{\infty} x^n = \frac{x(x+1)}{(1-x)^3} - \frac{x}{(1-x)^2} + \frac{1}{1-x}$$

$$= \frac{3x^2 - 2x + 1}{(1-x)^3}$$

$$\sum_{n=0}^{\infty} \frac{(-1)^n (n^2 - n + 1)}{2^n} = S\left(-\frac{1}{2}\right) = \frac{2^2}{2^3}$$

4. 将函数 $f(x) = \ln(3x - x^2)$ 在 $x=1$ 展开成 x 的幂级数.

$$3. f(x) = \ln x + \ln(3-x) = \ln[1+(x-1)] + \ln[2-(x-1)]$$

$$= \ln[1+(x-1)] + \ln 2 + \ln\left(1 - \frac{x-1}{2}\right)$$

$$= \ln 2 + \sum_{n=1}^{\infty} (-1)^{n-1} \frac{(x-1)^n}{n} + \sum_{n=1}^{\infty} (-1)^{2n-1} \frac{(x-1)^n}{n 2^n}$$

$$= \ln 2 + \sum_{n=1}^{\infty} \left[(-1)^{n-1} - \frac{1}{2^n} \right] \frac{(x-1)^n}{n},$$

$$-1 < x-1 \leq 1 \quad \text{且} \quad -1 < \frac{-(x-1)}{2} \leq 1 \quad \text{即} \quad 0 < x \leq 2$$

5. 将函数 $f(x) = \frac{1+x}{(1-x)^3}$ 展开成 x 的幂级数.

$$5. f(x) = \frac{1+x}{(1-x)^3}$$

$$\text{由 } \frac{1}{1-x} = \sum_{n=0}^{\infty} x^n \quad |x| < 1$$

$$\frac{1}{(1-x)^2} = \sum_{n=1}^{\infty} n x^{n-1} \quad |x| < 1$$

$$\frac{2}{(1-x)^3} = \sum_{n=2}^{\infty} n(n-1) x^{n-2}, \quad |x| < 1, \quad \frac{1}{(1-x)^3} = \frac{1}{2} \sum_{n=0}^{\infty} (n+1)(n+2) x^n, \quad |x| < 1$$

$$\text{故 } f(x) = \frac{1+x}{(1-x)^3} = (1+x) \sum_{n=0}^{\infty} \frac{(n+1)(n+2)}{2} x^n$$

$$= \sum_{n=0}^{\infty} \frac{(n+1)(n+2)}{2} x^n + \sum_{n=0}^{\infty} \frac{(n+1)(n+2)}{2} x^{n+1}$$

$$= 1 + \sum_{n=1}^{\infty} (n+1)^2 x^n = \sum_{n=0}^{\infty} (n+1)^2 x^n, \quad |x| < 1$$

考察收敛域

$$x=1 \quad \sum_{n=0}^{\infty} (n+1)^2 x^n \text{ 发散}$$

$$x=-1 \quad \sum_{n=0}^{\infty} (n+1)^2 (-1)^n \text{ 发散}$$

$$\text{综上, } f(x) = \frac{1+x}{(1-x)^3} = \sum_{n=0}^{\infty} (n+1)^2 x^n, \quad |x| < 1.$$

6. 将函数 $f(x) = \arctan \frac{1-2x}{1+2x}$ 展开成 x 的幂级数, 并求 $\sum_{n=1}^{\infty} \frac{(-1)^n}{2n+1}$ 的和.

$$6. f'(x) = \left(\arctan \frac{1-2x}{1+2x} \right)' = \frac{1}{1 + \left(\frac{1-2x}{1+2x} \right)^2} \cdot \left(\frac{1-2x}{1+2x} \right)' = \frac{-2}{1+4x^2}$$

$$f(x) = f(0) - \int_0^x \frac{2}{1+4x^2} dx.$$

$$\frac{2}{1+4x^2} = 2 \sum_{n=0}^{\infty} (-4x^2)^n \quad \left(-\frac{1}{2} < x < \frac{1}{2} \right),$$

$$\text{故 } f(x) = \frac{\pi}{4} - \int_0^x \left(2 \sum_{n=0}^{\infty} (-4x^2)^n \right) dx \quad \left(-\frac{1}{2} < x < \frac{1}{2} \right)$$

$$= \frac{\pi}{4} - 2 \sum_{n=0}^{\infty} \frac{(-1)^n 4^n}{2n+1} x^{2n+1} \quad \left(-\frac{1}{2} < x < \frac{1}{2} \right)$$

又 $f(x)$ 在 $x = \frac{1}{2}$ 处连续, 收敛域为 $(-\frac{1}{2}, \frac{1}{2}]$

$$f\left(\frac{1}{2}\right) = \frac{\pi}{4} - \sum_{n=0}^{\infty} \frac{(-1)^n}{2n+1} = 0 \quad \sum_{n=0}^{\infty} \frac{(-1)^n}{2n+1} = \frac{\pi}{4}$$
