

设体系微观状态波函数 Ψ, x 在此状态中的平均值为：

$$\langle x \rangle = \int_{-\infty}^{+\infty} x |\Psi(x, t)|^2 dx \quad (1)$$

微观粒子的平均速率可以表达为（考虑到 $\frac{dx}{dt} = 0$ ）：

$$\frac{d\langle x \rangle}{dt} = \frac{d}{dt} \int_{-\infty}^{+\infty} x |\Psi(x, t)|^2 dx = \int_{-\infty}^{+\infty} x \frac{\partial}{\partial t} |\Psi|^2 dx \quad (2)$$

下一步重要的是求出 $\frac{\partial}{\partial t} |\Psi|^2$

$$\frac{\partial}{\partial t} |\Psi|^2 = \frac{\partial}{\partial t} (\Psi^* \Psi) = \Psi^* \frac{\partial \Psi}{\partial t} + \frac{\partial \Psi^*}{\partial t} \Psi \quad (3)$$

根据薛定谔方程，我们有

$$\frac{\partial \Psi}{\partial t} = \frac{i\hbar}{2m} \frac{\partial^2 \Psi}{\partial x^2} - \frac{i}{\hbar} V \Psi$$

$$\frac{\partial \Psi^*}{\partial t} = -\frac{i\hbar}{2m} \frac{\partial^2 \Psi^*}{\partial x^2} + \frac{i}{\hbar} V \Psi^*$$

因此公式（3）变为

$$\Psi^* \frac{\partial \Psi}{\partial t} + \frac{\partial \Psi^*}{\partial t} \Psi = \frac{\partial}{\partial x} \left[\frac{i\hbar}{2m} \left(\Psi^* \frac{\partial \Psi}{\partial x} - \frac{\partial \Psi^*}{\partial x} \Psi \right) \right] \quad (4)$$

（4）代入到（2）中，我们有

$$\int_{-\infty}^{+\infty} x \frac{\partial}{\partial t} |\Psi|^2 dx = -\frac{i\hbar}{2m} \int \left(\Psi^* \frac{\partial \Psi}{\partial x} - \frac{\partial \Psi^*}{\partial x} \Psi \right) dx + x \left(\Psi^* \frac{\partial \Psi}{\partial x} - \frac{\partial \Psi^*}{\partial x} \Psi \right) \Big|_{-\infty}^{+\infty} \quad (5)$$

考虑到量子力学对波函数的要求，公式（5）右边第二项为零。（请同学们不要纠结于定积分里面有 ∞ ，根据波函数的要求， ∞ 处波函数必须为零，零乘以无穷还是零）

而公式（5）右边第一项，我们考虑再次利用分部积分：

$$\int \Psi^* \frac{\partial \Psi}{\partial x} dx = |\Psi|^2 \Big|_{-\infty}^{+\infty} - \int \frac{\partial \Psi^*}{\partial x} \Psi dx \quad (6)$$

公式（6）右边第一项为零，因此

$$\int \frac{\partial \Psi^*}{\partial x} \Psi dx = -\int \Psi^* \frac{\partial \Psi}{\partial x} dx \quad (7)$$

（7）代入（5），我们有

$$\begin{aligned} \int_{-\infty}^{+\infty} x \frac{\partial}{\partial t} |\Psi|^2 dx &= -\frac{i\hbar}{2m} \int \left(\Psi^* \frac{\partial \Psi}{\partial x} - \frac{\partial \Psi^*}{\partial x} \Psi \right) dx + x \left(\Psi^* \frac{\partial \Psi}{\partial x} - \frac{\partial \Psi^*}{\partial x} \Psi \right) \Big|_{-\infty}^{+\infty} \\ &= -\frac{i\hbar}{2m} \int \left(\Psi^* \frac{\partial \Psi}{\partial x} - \frac{\partial \Psi^*}{\partial x} \Psi \right) dx + 0 \\ &= -\frac{i\hbar}{2m} \int \left(\Psi^* \frac{\partial \Psi}{\partial x} + \Psi^* \frac{\partial \Psi}{\partial x} \right) dx \end{aligned}$$

$$= -\frac{i\hbar}{m} \int \Psi^* \frac{\partial \Psi}{\partial x} dx$$

所以：

$$\frac{d\langle x \rangle}{dt} = -\frac{i\hbar}{m} \int \Psi^* \frac{\partial \Psi}{\partial x} dx$$

根据定义，平均速率表达为

$$\langle v \rangle = \frac{d\langle x \rangle}{dt}$$

平均动量表达为：

$$\langle p \rangle = m \frac{d\langle x \rangle}{dt} = -i\hbar \int (\Psi^* \frac{\partial \Psi}{\partial x}) dx$$

从而：

$$p_x = -i\hbar \frac{\partial}{\partial x}$$
